

Hygrometry controlled structures

When the armies or the industry have traditional hangars, stored materials suffer from the effects of wind, dust, moisture, insects...

The setup of a suspended humidity controlled structure gives the opportunity to achieve optimal storage conditions, at the best price. Installation, operation and maintenance costs of these enclosures are significantly lower than those of a classically built structure and the positive effects are very quickly noticeable especially in terms of significant maintenance cost reduction for the stored equipment.

In the case of the protection of equipment in hot/cold countries, air conditioning or heating can be added to our structures.

These enclosures can be used as workstations providing a limited working enclosure (easier to control and keep clean).

Technical and building maintenance support is carried out by our specialists worldwide.

NOTE : We reserve the right to make changes and alterations which optimise our products or to ensure they correspond to the latest technology and specifications.
