

Covering and containment modules for de-pollution

Our covering and containment modules for de-pollution are used to cover a polluted site while it is being treated. Thus preventing the runoff rainwater on toxic products, but also to seal the site while it's being depolluted and prevent the emission of toxic gases or dust.

- Our dual metallic/textile structures meet all the wind and snow-load climatic norms for buildings.
- We have a range of air and water tight containment modules made of single or double layer material.
- Access to all our structures can be standard or via an airlock module.
- Our structures can have free spans of up to 50 meters in standard modules
- Side heights can go from 3m to 6m.
- Sieve of entry for containment keeping.

Special modules (case by case) :

- Storage tanks disposal.
- Buildings disposal.
- Buildings needed in cases of facility translation.
- Soil decontamination.
- Mud or soil treatment shelters.

Possibility to have controlled de-pressurised ventilation and/or filtration modules.
Technical support is carried out by our engineers and technicians all over the world.

NOTE : We reserve the right to make changes and alterations which optimise our products or to ensure they correspond to the latest technology and specifications.
